"Clinical and molecular study in congenital muscular dystrophy with

partial laminin alpha-2 (LAMA2) deficiency.";

Hum. Mutat. 21:103-111(2003).

C. -!- FUNCTION: Binding to cells via a high affinity receptor, laminin

C. is thought to mediate the attachment, migration and organization

of cells into tissues during embryonic development by interacting

c. vith other extracellular matrix components.

C. -!- SUBUNIT: Laminin is a complex glycoprotein, consisting of three

cd different polypeptide chains (alpha, beta, gamma), which are bound

to each other by disulfide bonds into a cross-shaped molecule

comprising one long and three short arms with globules at each

can The alpha-2 chain is a subunit of laminin-2 (merosin) and

can be applied to the subunit of laminin-2 (merosin) and
                                                                                                                                                                                                                                                                                                       entities

DOMAIN: The alpha-helical domains I and II are thought to intera with other laminin chains to form a coiled coil structure.

DOMAIN: Domains VI, IV and G are globular.

DISEASE: Defects in LAMA2 are the cause of merosin-deficient congenital muscular dystrophy type 1A (MDCIA) [MIM:667855]. MDCI is characterized by difficulty walking, hypotonia, proximal weakness, hyporeflexia, and white matter hypodensity on MRI.

SIMILARITY: Contains 1 laminin N-terminal domain.

SIMILARITY: Contains 2 laminin IV domains.

SIMILARITY: Contains 2 laminin G-like domains.
                                                                                                                                                                                                                                                                                                                                                               modified and this st

CATALYTIC ACTIVITY: COA + apo-[acyl-carrier protein] = adenosine 3',5'-bisphosphate + holo-[acyl-carrier protein].

COPACTOR: Magnesium (By similarity).

SUBGELLULAR LOCATION: Cytoplasmic (By similarity).

SUBGELLULAR LOCATION: Cytoplasmic (By similarity).
